345CPD Pain Management

The module is designed for healthcare professionals working with people in pain. The module content recognises a range of pain types across varied client groups in both hospital and community settings. Participants from different clinical and professional backgrounds can analyse the evidence base for effective pain management in order that they become competent practitioners in meeting bio-psychosocial needs of patients with pain. Inadequate knowledge continues to be one of the major barriers to pain management, inadequacies in the curriculum has been reported in a variety of health professions across different countries (Carr 2005:22 British Pain Society Newsletter Autumn). The module facilitates practitioners to rise to the individual challenges of pain management in their own sphere of clinical practice.
